

Product Carrier Washer

Improve Cleaning and Food Safety at Lower Costs

Sani-Matic Rack Washers are custom engineered to clean product carriers such as racks, trees, cages and trucks, which are conveyed on overhead rail or floor casters. The washers are designed with oscillating high-impact spray manifolds to ensure all carrier surfaces are reliably cleaned, removing difficult residues often found in smoked meat or bakery applications. Cleaning solutions are recirculated to provide water, chemical and utility savings, and the cabinet contains vapors and condensate to protect workers and food production areas. The carriers can be manually loaded into the washer and cleaned as a batch, or a continuous system can be designed. Sani-Matic Rack Washers will improve efficiencies by lowering total labor and optimizing a consistent rate of cleaning product carriers.

Solve the Problems of Manual Washing:

Inadequate coverage, unsafe rushed process and wasted utilities are common when washing manually. Sani-Matic's high pressure and high flow spray system is zoned to maximize coverage and cleaning impact, while conserving utilities and allows operator to perform other cleaning duties.

Problem

Solution

Standard Features:

IMPROVE CLEANING / FOOD SAFETY

- Higher impact and flow, continuous coverage, more effective than manual cleaning
- Consistent, dependable results from controlled process – documentable
- Eliminate tagged carriers, production delays and expense of rewashing

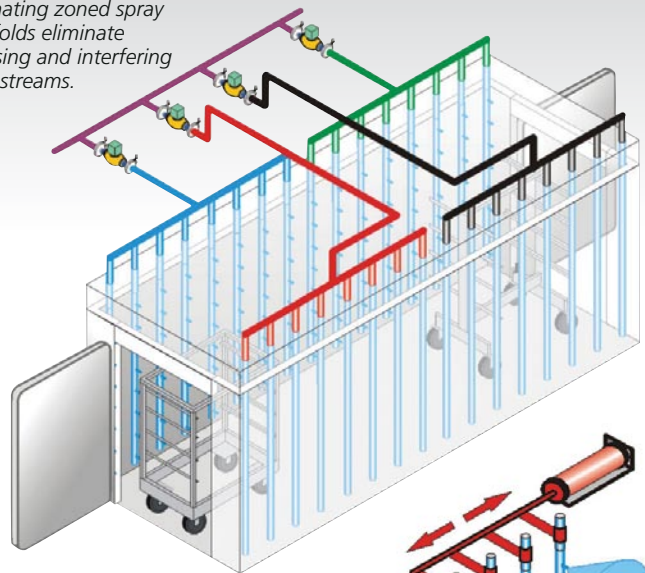

IMPROVE PRODUCTIVITY

- Eliminate downtime waiting for carriers
- Paced, constant reliable rate
- Reduce excess inventory of carriers
- Eliminate damage from manual cleaning

WORKER SAFETY

- Sealed cabinet contains high pressure spray, chemicals and steam
- Reduce handling, eliminate ergonomic problems
- Use higher temperatures and stronger concentrations safely

Alternating zoned spray manifolds eliminate opposing and interfering spray streams.

Zoned spray manifolds within the cabinet provide higher impact cleaning and allows higher flows with more nozzles to be utilized with the same pump volume. Recirculated solutions are continuously filtered through a strainer.

Spray manifolds oscillate to provide effective coverage on all surfaces from all angles.

Remote Solution Center eliminates pit

Reliable capacity paced with production flow. External CIP Solution Center conserves utilities.
